

BUSINESS CONTINUITY

Recovery of your most important asset.

What happens when your server won't boot up? Or a natural disaster strikes? Or you have a major power failure? Let's face it - things happen. And when it comes to your data and critical business applications, those things can be devastating. For small and medium-sized businesses, an IT failure can destroy a business – through the inability to operate, loss of critical documents, failure to deliver a service or project and, ultimately, the loss of customers.

At ANS, we are your business continuity experts. We have a number of solutions that can solve your business continuity concerns and we will work with you to find the right solution that fits your business's needs.

Business Continuity Planning

First things first. If you don't currently have a business continuity plan, we must first determine how your business will operate following an incident and how it expects to return to 'business as usual' in the quickest possible time afterwards.

ANS can not only help you determine your recovery point objective (RPO) and recovery time objective (RTO) but also implement a plan to meet them based on your business needs. Generally, those solutions fall into two categories - backup and disaster recovery.

Backup

Backup is the process of incrementally backing up your company's data. This is typically done onsite to a backup device but can also be replicated to a cloud environment.

Disaster Recovery

While backup protects your data, with our disaster recovery solutions your data will be replicated and ready when you need it. If your business continuity plan requires access to your data in a 24 hours or less, disaster recovery may be the right option for you.
